- A superheterodyne transceiver, comprising:
- a front end circuit with a differential pair, outputting
  a differential signal;
  - a transformer having primary and secondary side, wherein the primary side has a tap coupled to ground and two input terminals for receiving the differential signal, and the secondary side has an output terminal; and
  - a surface acoustic wave filter having an input terminal coupled to the output terminal of the secondary side, and an output terminal.
  - 2. The superheterodyne transceiver of claim 1, further comprising an intermediate frequency circuit having an input terminal coupled to the output terminal of the surface acoustic wave filter.
  - 3. The superheterodyne transceiver of claim 1, wherein the reactance of the input terminal of the surface acoustic wave filter is essentially capacitive.
  - 4. The superheterodyne transceiver of claim 1, wherein the reactance of the output terminal of the secondary side of the transformer is essentially inductive.
  - 5. The superheterodyne transceiver of claim 1, further comprising a matching circuit coupled between the output terminal of the secondary side of the transformer and the input terminal of the surface acoustic wave filter.

File: 0683-8295US/final/Dennis/kevin

6. The superheterodyne transceiver of claim 1, further
comprising a LC matching network coupled between the output
terminal of the secondary side of the transformer and the input
terminal of the surface acoustic wave filter.

- 7. The superheterodyne transceiver of claim 1, wherein the tap of the primary side of the transformer couples to the ground through a capacitor.
  - 8. The superheterodyne transceiver of claim 1, wherein the tap of the primary side of the transformer couples to a DC bias voltage through a resistor.
  - 9. The superheterodyne transceiver of claim 1, wherein the front end circuit comprises a mixer with an output terminal as the differential pair of the front end circuit.
  - 10. The superheterodyne transceiver of claim 1, wherein the front end circuit comprises a Gilbert cell.
    - 11. A superheterodyne transceiver, comprising:
    - a mixer with a differential pair, outputting a
       differential signal;
    - a transformer having a primary side with a tap coupled to ground, and a secondary side with an output terminal, wherein the primary side has two input terminals for receiving the differential signal; and
    - a surface acoustic wave filter having an input terminal coupled to the output terminal of the secondary side, and an output terminal.

1.

12. The superheterodyne transceiver of claim 11, further comprising an intermediate frequency circuit having an input terminal coupled to the output terminal of the surface acoustic wave filter.

- 13. The superheterodyne transceiver of claim 11, wherein the reactance of the input terminal of the surface acoustic wave filter is essentially capacitive.
- 14. The superheterodyne transceiver of claim 11, wherein the reactance of the output terminal of the secondary side of the transformer is essentially inductive.
  - 15. The superheterodyne transceiver of claim 11, further comprising a matching circuit coupled between the output terminal of the secondary side of the transformer and the input terminal of the surface acoustic wave filter.
  - 16. The superheterodyne transceiver of claim 11, further comprising a LC matching network coupled between the output terminal of the secondary side of the transformer and the input terminal of the surface acoustic wave filter.
  - 17. The superheterodyne transceiver of claim 11, wherein the tap of the primary side of the transformer couples to the ground through a capacitor.
  - 18. The superheterodyne transceiver of claim 11, wherein the tap of the primary side of the transformer couples to a DC bias voltage through a resistor.
- 19. The superheterodyne transceiver of claim 11, wherein the mixer comprises a Gilbert cell.
